

HISCORBADYNE SUPER STRESS

This information was generated by Gold Director Rowan Emrys, C.N.M.T., an independent distributor for DYNAMITE® Specialty Products. The views expressed herein do not necessarily reflect those of DYNAMITE® MARKETING, Inc. No claims are expressed or implied, and this information is not intended to diagnose, prescribe or cure.

This is a super-concentrated source of the **Hiscorbadyne** plus added blood builders and is critical for acute health challenges. We always keep a bucket handy to give when it is needed for a ten-day “shot” before backing off to use the **Hiscorbadyne** for longer periods of time. Because it is so potent, do NOT double up normal training amounts of **DYNAMITE® Regular or Plus** when feeding the **Super Stress** nor should you use it with any other blood builders of any kind nor any other brand of supplements or feed. Follow label directions carefully; too much of a good thing is *not* good!

We heard of one woman whose mare acquired a terrible case of chronic heaves after eating ash-laden hay following the eruption of Mt. St. Helens in 1980. She was able to control her unsoundness by conventional means until the spring of 1991, when the mare had a very serious attack and the usual battery of Recover, Theophilin, Glytussin, and Azium unfortunately did not work. Having been using some **DYNAMITE®** products for a few months, her supplier suggested **Super Stress**. The owner admitted she was skeptical, but chose to discontinue the expensive drug therapy and began dosing with the **Super Stress**. In just a few days, the mare was greatly improved with no straining to get her next breath, no double-breathing, no head-hanging. She continued to improve until she was back to normal and able to gallop on the beach for hours. And it has helped numerous other horses with heaves or border-line heaves become sound enough for high level competition.

Many competitors use rounds of **SuperStress** when competing all over the country to avoid illness when their horses are exposed to hundreds of other horses from all over. Generally starting 3-5 days before competition and during hauling seems to really boost the immune system.

Many **DYNAMITE®**-using trainers/owners, etc. consider **Hiscorbadyne** the first line of defense for bleeders at the track. They put the horse through a 10 day round of the **SuperStress** and then onto maintenance **Hiscorbadyne**; this seems to work

wonders. Many track and barrel racers give their horses the maintenance **Hiscorbadyne** at all times and switch to **SuperStress** two days before the event. The horses seem to get incredibly energized with one jockey playfully asking the trainer if he’d performed a “lube job” on a racing mare.

Before the advent of **Free and Easy** as a joint supplement, the **SuperStress** alone seemed to allow for a superior movement, propulsion and just plain energy. In fact, some **F&E** users still like to add a bit of **SS** to the formula to beef it up for some horses.

At the first sign of runny eyes or noses, we put horses on a 10-day round of **SuperStress** and follow it up with a 2-3 week round of **Hiscorbadyne** and, if it is a dark-skinned horse, perhaps a round of **SOD** as well, especially if the horse has exhibited a tendency toward frequent illness. Dark skins require more copper and copper, one of the ingredients in **SOD**, is vital to healthy immune systems.

REMEMBER THAT THIS PRODUCT, as are all the specialty products, is recommended to be used in *addition* to the Basics (all four free-choice minerals—**Izmine, NTM Salt, 1 to 1, 2 to 1—Dynamite Regular or Plus** and plenty of good grass hay) rather than *instead* of them. ■
